

THE IVF PROCESS

OVARIAN STIMULATION

The timing of the egg release is monitored by the fertility specialist in the application. While doing so the doctor makes sure that the hormonal level and other conditions for IVF are captured in the application.

EGG RETRIEVAL

The application captures the movement of the eggs from the female's ovary. It covers the process of Freezing to Thawing. The eggs are shifted to the incubator which is captured in the application.

FERTILIZATION

Here the most active sperm is fertilized in a special chamber. Then the egg and sperm are placed in a incubator and the process is monitored for the development of the healthy embryo.

EMBRYO TRANSFER

This is the last step where the healthiest embryo is transferred to the uterus is captured in the application.
