

The Writer approach to cater to the IVF Clinic needs

Current Scenario in IVF clinics

As the number of couples are getting delayed in bearing a child due to various physical, emotional stress, peer and family pressure and change in the lifestyle of individuals. There is a growing need for Fertility clinics and this has given rise to more and more IVF clinics coming up in the society.

An IVF clinic is a clinic where the couple visit does the initial consultation, discussion and based on the infertility test results will undergo the treatment accordingly. Currently this interaction of the couple and the doctor is done on paper and records are maintained on the paper.

Further treatments like IVF/ICSI/IUI their treatment cycle, treatment charts, medication are currently noted on paper and tracked which some time leads to mistakes and blunders hence there is a requirement for application software to capture this.

The medicines / injection used in this treatment are also very expensive but currently it is tracked on paper leading to mistakes and loss of revenue and information. An application to control this medicine /Injection is ideal in such situation.

If the Female has issues bearing a child the doctor may suggest to go for surrogacy which is expensive and legal in nature and tracked on paper as of now

During the treatment the doctor suggests Assisted reproductive technology (ART) procedures where sometimes the doctor use donor eggs, donor sperm, or previously frozen embryos or the couple may want to freeze their eggs and embryos for future use. This is also tracked manually in the canister right now and cause difficulty in tracking manually when the eggs and sperms become huge.

Why use **Writer IVF Solution** ?

The Writer IVF Solution takes care of the entire Infertility treatment cycle from registering the wife and husband with their demographic details, vital information, scheduling an appointment to start the consultation process with the doctor. The consultation and investigation details are also captured in the system and can be referred back as and when needed

Based on the consultation and investigation, the treatment cycle, the medicine and injection are suggested, recorded and alerted to the concern department for their action

The application takes care of the inventory of the injection and medicines, right from the raising a purchase order to issuing a medicine / injection to the patient with a correct bill thereby doing stock management

Using the application, the embryologist can monitor, manage and record the growth of embryos. The application solution takes care of the embryo freezing with all its parameters including tank, tray and canister.

If any Embryo or sperm is required using the application it can be located, thawed and used for the fertility treatment

The surrogacy module helps to register, manage the treatment, expenses and mapping the surrogate with intended parents

The ART module of the application takes care of managing the profile for the egg donor, sperm donor, egg recipient and egg recipient.

A software application like Writer IVF Solution helps in the digitization of all the processes of infertility treatment and is a one-stop solution for IVF clinics.
